Theme: Security satellite tracking for public and private service

- *User Story*

As a customer, I want to install a satellite tracking system in my vehicle in case of theft or any problem, I proceed to download the application on my Smartphone or from a computer, enter the website of the Satellite Vehicle Tracking service, enter my data to be able to register: names, surnames, identity card, email, telephone numbers and vehicle credentials with a photo of the license plate. Once registered, I proceed to request the installation of the control and tracking system in my vehicle, which will be confirmed by email. Once the shift is scheduled, I go to a dependency to have the device installed in the vehicle. When the system is already installed, I proceed to enter the application and log in with my data and with the unique key generated for my vehicle. If everything is configured correctly, when entering the application, a menu is displayed in which all the options that I can carry out are presented, such as tracking the location of my vehicle, controlling certain features remotely, etc. Each option is separated and cataloged in some windows for greater ease of use. From there you can have control over the vehicle and all the information will be sent in real time.
